

Arif Jaffery

Mobile No : +61 410155344
Email : jaff_arif@yahoo.com
VISA Type : Australian Citizen
Address : Sydney CBD

Career Objective

Aspiring Business and Application Architect with a strong foundation in subject matter expertise, committed to designing and delivering scalable, innovative MVPs that address real-world business challenges and drive digital transformation. Passionate about architectural excellence, user-centric design, and cross-functional collaboration to translate ideas into impactful, high-value solutions. I am deeply passionate about acquiring new technology skills and applying them during the construction phase of solution delivery, where ideas are transformed into tangible, functional systems.

I am seeking opportunities as an **Architect or Lead Developer**, ideally within the **banking, finance, insurance, superannuation, or government** sectors—where I can contribute to impactful projects and drive innovation through technical leadership.

Professional Summary

- I am a proactive and enthusiastic contributor within cross-functional squads comprising solution designers, architects, developers, testers, and DevOps specialists, focused on building modern cloud-based application platforms. As a subject matter expert in Open AI, Dynamics 365 / Power Platform, React / Next.js, Angular, .NET Core, and .NET Framework, I bring hands-on expertise across both frontend and backend technologies.
- I manage project repositories in Azure DevOps, aligned with tasks tracked in Jira and structured around Waterfall phases—gathering requirements, designing systems and software, developing solutions, conducting testing, and providing ongoing maintenance and support.
- My work is project-driven, collaborating closely with project managers, business analysts, and end users to identify business challenges and apply structured problem-solving to generate multiple solution pathways. I evaluate each option against a defined set of KPIs, derived from business processes, operating models, and governance frameworks (e.g., Australian Parliament). Through stakeholder engagement and team collaboration, I integrate business needs with technical solutions—leveraging frameworks, platforms, database systems, and cloud infrastructure (IaaS).
- I thrive in environments where mutual respect, equal opportunity, and adherence to best practices are valued—alongside a clear and progressive career path. Such settings foster both high-quality work and peace of mind, motivating individuals to perform at their best

Technical Skills

- **Business Domains** Banking & Finance, Insurance, Government, Regulatory Authority
- **Domain** Generative AI, Augmented Reality, Machine learning, Prompt Engineering
- **Architecture & Design** API (Restful/SOAP), Application, Data, Integration, Security, Cloud (AWS/Azure)
- **Methodologies** Waterfall & Agile Methodologies
- **Languages** JavaScript, PHP, Perl, C#, Java
- **AWS** VPC, EC2, Lambda Functions, Cloud SDK, CDK, S3, Dynamo DB
- **Azure** API/Web/FunctionApp, DataFactory, Service Bus, APIM, Azure DevOps
- **Power Platform** Dynamics 365, Power Microsoft Power Apps (Model Driven Apps, Canvas Apps, Portals Apps), Dataverse, Power Automate, Power BI (On-Premises Data Gateway),
- **Web Development** Angular, React, [Next.js](#), [Vue.js](#), CSS, Themes, Bootstrap, Prime NG, Material
- **JavaScript Frameworks** Node.js, Express, Redux, Gulp, Jasmine
- **Databases** MySQL, SQL Server, MongoDB, Oracle, CosmosDB

Professional Experience

1. Department of Home Affairs -Tech Lead (January 2025 – Present)

Project: Consolidation and Enhancement of Customer Engagement Platforms

Project Brief

Responsible for developing, customizing, and integrating an on-premise Dynamics 365 Customer Engagement solution to streamline business processes. Collaborated within a dynamic, cross-functional environment to transform business requirements into scalable, effective technical solutions using Microsoft .NET Core and .NET Framework. Led integration of Dynamics 365 with internal and external systems via REST/SOAP web services, and planned the migration and consolidation of legacy Dynamics 365 on-premise solutions to the Power Platform.

Key Responsibilities

- Led requirements gathering sessions and translated business needs into functional specifications.
- Configured and customized Dynamics 365 CE modules: Sales, Customer Service, Field Service, and Finance & Operations.
- Designed and implemented workflows, business process flows, and Power Automate Cloud Flows.
- Collaborated with technical teams to integrate Dynamics 365 with external systems.
- Developed domain-driven APIs and maintained multiple portals using React and TypeScript.
- Created schemas for customized Customer Engagement solutions, including entities, relationships, forms, business rules, and processes.
- Built workflows following best practices, separating business logic from plugin assemblies.
- Developed unit tests for workflows and plugins using fake CRM contexts and execution environments to validate business logic and bug fixes.
- Practiced CI/CD using Azure DevOps and managed Git repositories for source control.
- Utilized Sparkle XRM to generate artifacts, deploy CRM solutions, and manage workflows/plugins.
- Enabled document management in Dynamics 365 via SharePoint integration.
- Enhanced Dynamics 365 dashboards using SharePoint Framework (WebPart) with React and TypeScript.
- Conducted user training and provided post-implementation support.
- Integrated Stripe payment processing using Power Pages and Power Automate.
- Developed Azure Functions and API Apps to interface with AusCheck background check platforms.
- Managed Dataverse capacity and billing plans to optimize storage costs and maximize ROI.

Technical Environment

.NET Core, .NET Framework, React, Microsoft Dynamics 365 (v9.1.31.10), Power Platform, FakeItEasy, Sparkle XRM, NSubstitute, Microsoft ESB, Microsoft Azure

2. Bank of Queensland - Senior Engineer (January 2021 – December 2024)

Project: Banking Integration Platform

Project Brief

Served as a full-stack engineer responsible for designing and developing integration components across key business streams, including:

- Customer Onboarding
- Core Banking Platform
- Card & Payments
- NPP Compliance
- Open Banking
- Home Loans

- Loan Origination

Applied solid design principles and patterns (Creational, Structural, Behavioral) to build scalable application foundations. Delivered end-to-end solutions from requirement gathering to deployment, with a strong focus on integration architecture and cloud-native development.

Key Responsibilities & Contributions

- Requirement Gathering & Agile Delivery
 - Collaborated with large cross-functional teams including PMs, BAs, Scrum Masters, architects, developers, and testers.
 - Participated in sprint planning and backlog refinement using Jira and Azure DevOps.
 - Translated business requirements into technical designs and implemented features across multiple sprints.
- Design & Architecture
 - Built SPAs using Angular and React, enriched with CSS/SCSS frameworks.
 - Mapped requirements into reusable components and services, managing shared and individual states via API-driven architecture.
 - Applied dependency injection to decouple logic and improve maintainability.
 - Designed backend microservices using CQRS and event-driven architecture, deployable across cloud and compute environments.
 - Applied SOLID principles: single responsibility, open/closed design, inheritance hierarchies, dependency inversion, and interface segregation.
- Build & DevOps
 - Managed Git repositories with branching strategies (GitFlow, trunk-based development).
 - Created feature branches, conducted code reviews via pull requests, and maintained metadata using markdown templates.
 - Built CI/CD pipelines in Azure DevOps to automate artifact generation and deployment.
- Testing & Release Management
 - Supported integration testing, triggered test processes, and captured outputs for evidence.
 - Raised change requests in ServiceNow and presented test data to the Technical Advisory Board for production release.
- Integration & Domain-Driven Design
 - Defined interface contracts for banking workflows, ensuring secure and seamless integration across systems.
 - Led legacy system transformation to domain-driven design, identifying core/sub-domains and mapping entity relationships.
 - Designed Domain-Driven API components using CQRS, mediator pattern, and design patterns like singleton, factory, adapter, and observer.
- Scaled Agile Framework (SAFe)
 - Operated within a large enterprise using hybrid SAFe configurations (Essential, Large Solution, Portfolio, Full SAFe).
 - Promoted alignment, built-in quality, transparency, and program execution.
 - Collaborated using tools like Jira, Confluence, Azure DevOps, Miro, and the SAFe Community Platform.
- Cloud-Native Development & AI Tools
 - Leveraged AI tools like GitHub Copilot and ChatGPT to write clean, efficient code.
 - Built highly reliable, scalable, and cost-effective frontend/API components for business banking applications.
 - Developed RESTful services in Node.js/TypeScript and provisioned infrastructure using AWS CDK.
 - Created Lambda functions and REST API gateways within VPCs, deployed containerized APIs via ECS and EKS using Fargate.
- CRM & Power Platform
 - Enhanced Microsoft Dynamics CRM with custom plugins, workflows, and scripts (C#, JavaScript).

- Built Power Platform solutions: apps, automated processes, Dataverse models, Power BI dashboards, and custom connectors.
- Data Engineering & Compliance
 - Designed robust data architectures and managed ETL pipelines using Azure Data Factory and Databricks.
 - Integrated data into Azure Data Lake, Azure SQL Database, and Cosmos DB.
 - Ensured security and compliance across all solutions, aligning with regulatory standards.
- Technical Leadership & Collaboration
 - Worked closely with analysts, business users, and developers to convert specifications into technical designs.
 - Created RESTful and SOAP services based on system requirements and industry best practices.
 - Built dynamic, responsive web applications using Angular and React.
 - Conducted testing, implementation, and ongoing maintenance to ensure performance and quality.
 -

Technical Environment

Azure (App Configuration, Active Directory, Apps, Data Factory, APIM, Application Insights, Cosmos DB, Containers, Data Lakes, Function Apps, Compute, Event Hub, Event Grid, Logic Apps, Monitoring, Service Bus, Service Fabric, Storage Accounts), Azure DevOps, AWS (CDK, Lambda, ECS, EKS, Fargate), IBM IIB, Apache Kafka, Kubernetes, Java, .NET Core, .NET Framework, Pega, T24 Core Banking Platform, Power Platform, Dynamics 365

3. Department of Education, Skills and Employment - Senior Developer (August 2020 – January 2021)

Project: VET ePoC – Vocational Education and Training Event-Based Platform

Project Brief

The VET ePoC project aimed to deliver a cloud-based, event-driven system that enables near-real-time, system-to-system data exchange for validating and collecting Vocational Education and Training (VET) data. The initiative sought to transform the VET sector by enhancing data quality and timeliness, enabling data-driven insights for consumer information, program management, regulation, and policy development. It also streamlined processes for over 4,000 Registered Training Organisations (RTOs) serving more than 4 million students annually.

Mandate & Responsibilities

Developed a digital platform for the VET program using cloud-native microservices architecture. The solution comprised API components with enriched controllers, deployed across Azure Service Fabric clusters in multiple environments. Each cluster contained nodes and applications, with each application functioning as a discrete component. Business logic was decoupled from infrastructure using InRule—a rule-based system with rules managed in catalogue repositories.

Key Contributions

Client UI Layer: Developed thick-client authoring software for rule creation.

Cloud UI Layer: Built web-based applications for managing rule catalogues and system configurations.

Microservices Development:

Validation Query Services: Enabled querying of staging databases to return validation results.

Data Collection & Processing: Implemented mechanisms for clients to submit validation requests and retrieve results.

Data Query Services: Exposed master database reference data (e.g., completion codes, funding codes) for use by training providers and authorities.

Data Import Services: Facilitated API-based loading of reference data into the master datastore.

Business Logic:

Rule Engine: Executed business rules against submitted data for validation.

Data Storage Architecture:

Rule Database: Stored authored rules.

Staging Data: Captured outcomes of validation requests.

Master Data: Held validated data post-rule execution.

Analytics Data: Stored processed data for reporting and insights.

Technical Environment

Git, Visual Studio Enterprise 2019 (v16.7.2), .NET Core 3.1, Microsoft.AspNetCore.Mvc, Microsoft.Azure.DocumentDB.Core 2.10.3, Microsoft.Azure.ServiceBus, AutoMapper 9.0.0, FluentValidation 8.6.2, ReSharper 106.11.7, StyleCop.Analyzers 1.1.118, Azure Service Fabric Cluster, Azure Cosmos DB, Azure Storage, Azure Key Vault, Azure DevOps, Azure SQL, Azure PowerShell, App Service Plans, MSDeploy, InRule irAuthor v5.6, irCatalogue Manager, Microsoft.ApplicationInsights.AspNetCore 2.13.1, Microsoft.Extensions.DependencyInjection 3.1.5, Microsoft.ServiceFabric.AspNetCore.Kestrel 4.0.470, Swashbuckle.AspNetCore 5.3.3, Microsoft.AspNet.WebApi.Client 5.2.7, Microsoft.EntityFrameworkCore.SqlServer 3.1.5

4. BlueScope Steel / Avenair – Lead Developer DXC Contract | January 2020 – July 2020

Project: Future Integration Platform (FIP)

Project Brief

Led the development of FIP, a cloud-native integration platform built on microservices architecture using Azure Integration Platform as a Service (IPaaS). The solution replaced a legacy point-to-point integration model that had caused performance bottlenecks and long lead times. The new architecture introduced scalable, event-driven components including API Apps, Client Adapters, Function Apps, Process APIs, System APIs, Experience APIs, and Event Adapters.

From a business process perspective, the platform enabled secure exchange of EDI industry-standard messages (GS1, AS1) and push notifications using modern protocols such as OAuth 2.0. The initial implementation focused on the Order-to-Cash lifecycle, replacing legacy A2A and B2B systems.

Mandate & Responsibilities

- Designed and developed integration components based on detailed design specifications.
- Implemented and tested components using Behaviour-Driven Development (BDD) frameworks, including unit and component-level test cases.
- Contributed to the modernization of enterprise integration by applying microservices principles and cloud-native patterns.

Technical Environment

Microsoft Visual Studio Enterprise 2019, ASP.NET Core, Application Gateway, API Management, App Registration, API Apps, Azure Blob Storage, Event Grid (Topics & Subscriptions), Web Application Firewall (WAF), Azure Service Bus 3.4.0, Azure Key Vault 2.2.0, ASP.NET Web API 5.2.7, Application Insights 0.9.0-preview, .NET Test SDK, MSTest Framework 2.1.1, Polly 7.2.0, ASP.NET Core HTTP Extensions, Azure Service Bus Extensions, Hosting & Logging Extensions, Microsoft Identity Model Clients (Active Directory), Newtonsoft.Json, Polly Extensions, System.IdentityModel.Tokens.Jwt

5. Experis – Lead .NET Developer Contract | February 2019 – December 2019

Project: MANTIS – DET Portal Development

Project Summary

Served as Lead .NET Developer, responsible for full-stack development across frontend and backend layers. The project involved building the DET Portal, which included modules for Admissions, Compliance, Finance, and Marketing.

Mandate & Responsibilities Led the design and development of APIs, architectural blueprints, and Angular components and services. The backend followed an Onion Architecture comprising Core, Infrastructure, Application, and Presentation layers.

Key Contributions

- **Architecture & Design**
 - Applied SOLID design principles, including dependency inversion using Windsor Castle to create IoC containers.
 - Designed and implemented the Repository pattern to access data models from Microsoft SQL Server.
 - Built API layers with full CRUD functionality for business repositories.
 - Developed API connectors for authentication and document management systems.
- **Agile Methodology**
 - Actively participated in daily stand-ups, sprint planning, sprint demos, and retrospectives.
 - Collaborated with Scrum Masters to identify features and resolve blockers.
 - Documented achievements, learnings, and gaps for continuous improvement.
- **Development & Coding**
 - Created data and business models using Entity Framework (Code First approach).
 - Managed database migrations and context synchronization via NuGet Package Manager Console.
 - Defined business models using container classes, AutoMapper, LINQ, and lambda expressions.
 - Developed service classes for business processes with lazy-loaded repository instances.
 - Built UI components using Angular 7, Angular Material, and PrimeNG.
 - Developed Single Page Applications with Angular routing and core components (Landing, Layout, Dashboard, Work Tray).
 - Created injectable services and shared state using Angular Injector and EventEmitter.
 - Implemented CRUD chaining with Promises and reactive pipelines using RxJS operators (map, tap, merge, forkJoin, of, from).
 - Applied Angular Router CanActivate Guards for access control.
 - Used Reactive Forms with custom validators via closures and callback functions.
 - Built dynamic Work Tray interfaces using Angular Material and PrimeNG DataTables.
 - Defined interfaces for container classes and bound them to the DOM using two-way data binding.
 - Implemented SSO (Single Sign-On) integration with DET Staff Portal.
 - Developed middleware using Media Type Formatters to handle multipart document uploads.
 - Configured Visual Studio Online TFS, managed branching strategies, and supported multi-environment deployments.
 - Created a proof-of-concept marketing portal using Sitecore CMS.

Technical Environment

Microsoft Visual Studio Professional 2017–2019, .NET Framework 4.6, Team Foundation Server (TFS), Angular CLI (Angular 7), JIRA, Windows Azure, AWS, Microsoft SQL Server 2016, Sitecore CMS

6. CAF Ship / CIBIS International – Lead Developer Contract | November 2018 – January 2019

Project: CAF Shipping Trading Portal – Tendering & Calculator Module

Company Summary

Central African Shipping Lines & Logistics Company Ltd. (CAFSHIP) was established in 2004 as a maritime services provider operating across Cameroon and the broader Sub-Saharan African region. Founded by a seasoned industry expert, CAFSHIP has built a strong presence in the Gulf of Guinea. The company is now expanding its onshore and offshore operations to include environmental services and the supply of maritime vessels, primarily serving oil and offshore industries.

Project Brief

Led the development of new tendering and calculator modules within the existing CAF Shipping Trading Portal. The goal was to enhance platform functionality and support the company's expanding logistics and maritime operations.

Mandate & Responsibilities

- Provided technical leadership and architectural guidance across system integration, application design, and cross-platform interoperability.

- Designed and developed a responsive Single Page Application (SPA) using Angular 6 and TypeScript, including components, directives, and services.
- Delivered logical and physical high-level designs aligned with best practices and design patterns.
- Architected and implemented a robust security module for authentication and authorization using Web API, OWIN, OAuth 2.0, JWT, and ASP.NET Identity Framework.
- Created unit tests for .NET applications using Visual Studio Unit Testing Framework; tested Angular components and services using Jasmine and Karma.
- Applied Database-First Entity Framework, leveraging LINQ and lambda expressions for efficient data processing.
- Designed and developed complex stored procedures and triggers to support backend logic.
- Utilized Gremlin API to store and query data on Azure Cosmos DB.

Technical Environment

Microsoft Visual Studio Professional 2017, Tortoise SVN, Angular CLI (v7.1.1), PrimeNG Commercial, AWS, ASP.NET Framework 4.5, Bootstrap, Entity Framework 6.1, LINQ, Lambda Expressions, Web API 2.0, WCF Services, NuGet Package Manager, Node.js, Gulp, Jasmine, Karma, Azure Cosmos DB, Gremlin API, HTML5, IIS 7.5, SQL Server 2016, Drupal CMS

7. Paxus – Lead Developer / Architect Contract | May 2018 – October 2018

Project: Demand Manager – Lead Developer / Architect

Project Brief

The Demand Manager component was designed to automate candidate selection and execute debt-related use cases using the existing Operational Analytics platform. Actions included issuing warning letters, initiating garnishee orders, and triggering outbound communications such as phone calls. The solution was rule-driven and integrated with enterprise systems.

Mandate & Responsibilities

- Architected and developed new features for the Demand Manager platform.
- Collaborated with Enterprise Architects to design and build the Enterprise Data Hub (EDH).
- Enhanced the GUI by implementing a UI rendering pipeline.
- Built end-to-end data pipelines from the GUI to OA2/EDH.
- Managed system capacity and performance.
- Established authorization mechanisms using the ASP.NET pipeline.

Technical Highlights

- Applied layered architecture and SOLID design principles.
- Used generics to decouple functions and classes from data types.
- Implemented the Observer pattern using delegates.
- Utilized collection classes (List, Queue, Stack) and worker threads for client-server architecture.
- Developed asynchronous processing using async/await and task delegates.
- Employed dependency injection for modular design.
- Used Entity Framework (Code First) for object-relational mapping.
- Queried and updated SQL Server using LINQ and stored procedures.
- Integrated with IBM WebSphere MQ for message exchange.
- Built Windows Services to process incoming MQ messages.
- Developed WCF services to detect XML file drop-offs and route them to data pipelines.
- Created the Demand Manager GUI using Angular.js:
 - Routing pipeline, RESTful services, Angular modules, controllers, named views, and directives
 - File upload functionality for use case submission
 - Automated testing with Jasmine and Karma
 - Unit testing using Visual Studio Test Project

Environment

Microsoft Visual Studio Enterprise 2015, TFS, Angular.js, IBM Integration Toolkit 10.0.0.11, IBM WebSphere MQ Explorer 8.0.0.0, JIRA

Project: Service Layer Design (Enterprise Data Hub) – Lead Developer

Project Brief

The Enterprise Data Hub (EDH) served as the central component of the enterprise data and analytics architecture. Built on Cloudera Hadoop, it stored data in HDFS and exposed APIs for real-world entities such as Party, Document, Form, and Client. These APIs formed the basis of an ontology-driven microservices architecture using Spring Boot MVC, supporting future analytics and customer-facing applications.

Mandate & Responsibilities

- Designed and implemented new service layer features.
- Ensured compliance with IT Standard 95 for RESTful services.
- Stored data in HDFS using NoSQL HBase.
- Designed authentication pipelines (Basic, Kerberos, OAuth2).
- Versioned service endpoints and managed rollout/rollback strategies.
- Planned UI rendering pipelines in Angular using components and services.

Technical Highlights

- Defined RESTful constraints for web service design.
- Enabled cross-platform interoperability using singleton patterns.
- Built standalone Spring Boot applications and Maven projects.
- Developed CRUD APIs with dependency injection.
- Applied functional programming techniques (filter, map, reduce, sort).
- Used dependencies such as Jackson, Apache Hadoop, and HBase Client.
- Annotated services with Spring Boot and Jackson annotations (e.g., @RestController, @Service, @RequestMapping).

Environment

Java 8, Spring Boot, Eclipse Neon, Spring Tool Suite, Selenium, TFS, Red Hat Enterprise Linux 7.1 (Maipo), Cloudera Manager Enterprise 5.14.3, Hadoop 2.6.0-cdh5.15.1, Hue (Impala & Hive), Jenkins, Postman 6.3.0, FastX 2.0.77, Putty, WinSCP, Apache JMeter

Project: Next Best Action (Proof of Concept) – Developer

Project Brief

Developed a proof-of-concept solution to support debt, payment, and Single Touch Payroll operations. The system automated interactions without human intervention, anticipating pre- and post-due date scenarios and escalating actions based on business rules. It was event-driven and integrated with IBM Decision Server Insight and IBM Operational Decision Manager.

Mandate & Responsibilities

- Translated business requirements into workflows using IBM Integration Bus.
- Integrated IBM WebSphere MQ, Decision Support Insight, Operational Decision Manager, SQL Server, and EDH (Cloudera Hadoop).

Technical Highlights

- Created applications, integration services, message flows, models, MQ services, decision services, and REST APIs using IBM Integration Bus 10.0.0.11.
- Defined Business Object Models and complex event processing logic in Decision Support Insight.
- Built IIB flows using nodes such as MQ Input/Output/Reply, Compute, .NET Compute, Transform, Route, Route-To-Label, and Publication.

8. Google – Lead Developer / Architect March 2018 – May 2018

Project: Google Cloud Management Tool

Project Brief

Led the development of a cloud debugging tool leveraging Google Census data. The tool visualized cloud infrastructure as a graph of interconnected nodes and edges, representing Remote Procedure Call (RPC) dependencies. These RPC graphs enabled root cause analysis by mapping dependencies between cloud products and project numbers, which were linked to Borg users. Key performance metrics—including QPS, error ratio, latency, and CPU usage—were used to render and filter graph views.

Mandate & Responsibilities

- Architected and implemented new features across the platform.
- Redesigned the Landing Page and RPC Dependency Graph components.
- Built the Metric Mapping component and Dependency Graph Service.
- Developed metric-based graph rendering and filtering capabilities.

Technical Highlights

- Created Go scripts to retrieve protocol buffer data from Google Analytics.
- Defined complex data structures using Go struct types.
- Built Go packages and functions to support color-coded metric mapping and executable services.
- Developed REST API endpoints with full CRUD operations (GET, PUT, POST, DELETE).
- Used mux (HTTP request multiplexer) for routing and pipeline implementation.
- Built a Go-based API server using the http package.
- Managed repositories with Piper and configured local environments using g4d.
- Developed Angular services and components using ES2015.
- Applied dependency injection for state management and routing with pre-resolved data.
- Designed UI templates using Angular Material.
- Conducted unit and end-to-end testing with Jasmine and Karma.
- Deployed the GOSHAWK Server using Blaze, Google's proprietary build system.

Environment

HTML5, CSS3, jQuery, Angular.js, ECMAScript 2015, Angular Material, Angular Animate, Angular Message, Angular Aria, Jasmine, Karma, Angular Mock, Cytoscape.js, Cider, Piper, Critics, Blaze, Go Server, Google Build System (g4d), Debian Linux, Go 1.10 and earlier versions

9. Experis, Canberra, Australia – Lead Developer / Architect Contract | July 2017 – January 2018

Project: CCP (Childcare Provider)

Project Brief

The CCP (Childcare Provider) project aimed to streamline the complex and error-prone process of claiming childcare benefits and rebates, previously managed by the Department of Education and processed through the Department of Human Services' SAP CRM Claims System. The solution involved building a unified, REST-based architecture that

integrated multiple systems, including PRODA (authentication), ACECQA (Australian Children's Education & Care Authority), and SAP CRM via OData services.

My role focused on architecting the frontend using Angular and developing backend services in Node.js to facilitate secure, scalable communication between systems. I built core Angular components for Provider Approval, Service Timings, and Document Lodgement, and developed RESTful APIs using Express and body-parser. Angular routing was implemented using a resolver-based model, with services designed to fetch models from the backend.

Mandate & Responsibilities

- Architected and developed Angular 4 reactive components and RESTful services for ACECQA validation workflows.
- Built REST endpoints for providers, services, and service personnel using Node.js and Express.
- Developed a document lodgement service integrated with SAP CRM via NetWeaver Gateway.

Technical Highlights

- Created Angular 4 modules, components, services, directives, and REST APIs.
- Built APIs using Express Router and Node.js middleware pipelines.
- Used TypeScript to define and extend classes and interfaces.
- Designed component hierarchies optimized for Angular's change detection strategy.
- Implemented routing with resolvers to preload models before component activation.
- Applied Angular binding techniques: interpolation, property/event binding, and attribute binding.
- Enabled component interaction using EventEmitters and shared services.
- Utilized RxJS operators (e.g., map) for reactive programming.
- Chained Promises to orchestrate asynchronous operations.
- Implemented both client-side (sync/async) and server-side validation for business objects.
- Used reactive forms to construct UI with FormGroups, FormArrays, and custom validators.
- Applied dependency injection across UI and non-UI components.
- Developed RESTful services to communicate with SAP CRM and other systems.
- Documented APIs using Swagger and YAML.
- Used Gulp for server-side task automation: cleanup, linting, minification, build, and deployment.

Environment

HTML5, CSS3, jQuery, Angular 4 / React, JavaScript (ECMAScript 2015), TypeScript (ES6), SVN (Apache Subversion), GitHub, Node.js, Express, body-parser, Gulp, Jenkins, SASS, LESS, Visual Studio Code, MongoDB, DB2, SharePoint, SAP CRM, SAP NetWeaver Gateway

Education

- **Bachelors of Computer Science** University of Karachi

Certifications & Training

- Microsoft Certified .NET MVC Developer TLABS Michigan, Certificate Number: G078-6984
- EXIN ITIL Foundation Service Management Certificate Sydney Australia, Certificate Number: 5781589.20572275
- Oracle Java Certified Developer Sydney Australia, Certificate Number: OC1619809
- ISTQB Certified Tester Australia New Zealand Testing Board, Sydney, Certificate Number: FND19040
